DETAILED ACTION

Allowable Subject Matter

1. Claims 1-28 are allowed.

Examiner's Statement of Reasons for Allowance

3. The following is an examiner's statement of reasons for allowance:

Independent claims 1, 11 and 18 recite a method of determining the proximity of a target node to a source node wherein a source node sends a communication such as a signal to a target node and immediately upon receiving the signal, the target node sends a response back to the source node (the time elapsed between the sending of the query and the response is measured). The target then processes the query to include a variable which the source will use to verify the target and then sends back the second response to the source. The time between the sending of the first query and the receipt of the first response is measured and used by the source to determine the proximity of the target node from the source. This measured communication time is then compared to a threshold value and based on the outcome (lower than threshold or higher than threshold), the source can determine if the target is a local node or remote node and further compares the measured time to a plurality of thresholds to determine how remote (degree of remoteness) the target node is. The invention further requires the source node using the determined local or remote location to control communications with the node. i.e., based on whether a node is remote or local, communications between the source and that node can be allowed or restricted. Lundkvist (US-20030184431) teaches a method for controlling authorization to an object in which a signal is communicated thru electromagnetic wave between a first and second node. The first signal is used to measure the distance between the nodes and to determine the proximity based on a predetermined value. The second signal is used to convey

authorization information between the nodes. This is quite different from the invention disclosed in the present case. The present invention further determines if a target node is local or remote based on the measured time and also determines a measure of remoteness based on multiple thresholds and communicates with a target node based on its location (either local or remote). Lundkvist fails to teach this novel aspect of the present invention and the secondary reference, Davis (US-6088450), fails to remedy the deficiencies of Lundkvist as it fails to teach a measure of remoteness using varying thresholds and also communicating with a target node based on the local/remote location determination. In view of the explanation above, the claims as presented in the application overcomes the prior art of record and other prior art references presented in the course of prosecution.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
